HIGHLIGHTS OF THE 1986
VITAL STATISTICS IN MARYLAND

BIRTHS

There were 69,524 resident live births occurring during 1986. This represented a 2.3% increase in births over the 1985 total of 67,985. This was the largest number of births for the State since 1968. Births decreased slightly for the United States between 1985 and 1986.

The crude birth rate rose less than one percent from 15.5 to 15.6 births per 1,000 population. This matched the U.S. rate which had consistently been above Maryland's rate since 1970. The white rate remained the same, between 1985 and 1986; while the rate for all other races rose from 20.1 to 20.5 (2.0% increase).

Birth rates increased in only nine of the 24 political subdivisions in the State, while remaining unchanged in two. Baltimore City exhibited the highest birth rate, 17.6, while the lowest rate 11.8 occurred in both Allegany and Kent counties. In the Baltimore Metro Area, Baltimore County's rate of 13.8 was the lowest.

The general fertility rate, the total number of births per 1,000 women aged 15-44, increased slightly from 62.1 to 62.3 (less than one percent). The national fertility rate of 65.4 was five percent higher than Maryland's. For white women, the rate dropped slightly from 57.2 to 57.1; while the rate for women of other races increased from 74.8 to 75.7 (+ 1.5 percent).

Birth rates increased for women 30 and over only. Birth rates for white women were lower than those for women of all other races for all age groups except the 30-34 age group. The largest differences in rates between the racial groupings occurred for women under 15 and women aged 15-19 where the rates for women of all other races were respectively 7 and 2 times the rates for white women.

Women aged 15-19 residing in Baltimore City experienced the highest birth rate for that age group among all political subdivisions (81.9). Montgomery County women exhibited the lowest rate (17.2) for this teenage group. Montgomery and Howard Counties showed the two highest birth rates, respectively, among older women aged 30-34 and 35-39.

Birth Rates* by Age of Mother and Fertility Rates, State of Maryland 1960, 1970, 1980, 1985, 1986**

Age of Mother	1960	1970	1980	1985	1986
15 - 19	98.6	68.6	43.6	41.2	40.2
20 - 24	254.8	145.3	91.7	96.6	95.3
25 - 29	199.3	132.7	95.7	109.8	109.5

1985	62.1	27.9	20.6	8.4	4.2
1986	62.3	27.8	20.8	8.5	4.2

*Rates are Live Births per 1,000 Women Aged 15 - 44.
**Rates for 1971 and 1972 Computed Using 1970 Census Population.

The small rise in the fertility rates between 1985 and 1986 was also evidenced in the small increases in birth rates for second and third birth orders. Live-birth order refers to the number of children born alive to a mother. Birth rates for women having a second or third child were either equal to or higher than any rate since 1972.

Among women having their first child, increases in rates occurred for women thirty and over only. Increases of 6.4 percent and 17 percent occurred for women aged 30-34 and 35-39, respectively. Since 1970, the rates for women 15-19 and 20-24 having a first birth have declined 40.5 and 29.4 percent, respectively, while the rates for women 25-29, 30-34 and 35-39 have increased 37.0, 222.2 and 195.2 percent, respectively.

Birth Rates* by Age of Mother
Maryland, 1970 - 1986

First Birth Order

	Age of Mother				
Year	15-19	20-24	25-29	30-34	35-39
1970	53.8	70.3	32.7	7.2	2.1
1971	52.0	65.9	32.9	7.4	2.0
1972	48.6	56.0	34.8	8.2	1.9
1973	39.5	47.0	32.4	8.5	1.8
1974	37.3	44.0	33.3	8.8	2.1
1975	35.2	42.6	32.3	9.2	1.9
1976	35.2	41.6	33.6	10.3	2.2
1977	35.6	43.4	35.9	12.3	2.5
1978	33.7	43.7	36.3	13.2	2.8
1979	35.8	48.7	37.8	13.6	3.8
1980	35.7	50.5	39.6	14.7	2.9
1981	32.9	51.7	42.8	16.7	3.2
1982	33.7	53.0	43.2	17.9	3.9
1983	34.1	50.2	43.0	19.5	4.2
1984	32.9	49.9	42.9	20.7	4.9
1985	32.3	51.1	44.9	21.8	5.3
1986	32.0	49.6	44.8	23.2	6.2

*Rates are Live Births per 1,000 Women in Each Age Group.

Births to Unmarried Women

As estimated 21,188 unmarried women gave birth in 1986. This number represented an increase of 7.2 percent over the 1985 figure of 19,761. For white unmarried women, there was an eight percent increase in births; while for women of all other races, the number rose 6.8 percent. Almost 13.2 percent of nonmarital births occurred to women 17 years and younger. In Maryland in 1986, 15.8 percent of white births, and 57.8 percent of births of all other races occurred to unmarried women. Nationally, 15.7 percent of white births, 52.4 percent of births of all other races including blacks, and 61.2 percent of black births were nonmarital births.

Low Birth Weight

In 1986, 7.7 percent of all live births were classified as being of low birth weight, weighing less than 2500 grams. By race, 5.5 percent of white births, and 12 percent of births of all other races were born weighing less than 2500 grams. These figures represented increases of 1.8 percent for white births, and no change for all other races. Nationally, 5.6 percent of white infants, 11.2 percent of infants of all other races including blacks, and 12.5 percent of black infants were of low birth weight.

Length of Gestation

Length of gestation refers to the interval between the last normal menstrual period and the date of birth. Delivery prior to 37 weeks gestation is classified as pre-term. In 1986, 8 percent of white births and 16.8 percent of births of all other races occurred prior to 37 weeks gestation. Births occurring at 42 weeks and over are classified as post-term deliveries. In 1986, 13.8 percent of all births, 14.6 percent of white births, and 12.3 percent of births of all other races were classified as post-term deliveries.

Prenatal Care

More than 80 percent of mothers reporting month of onset of prenatal care made their first prenatal visit in the first trimester of pregnancy. This proportion was one percent higher than the 1985 percentage. The proportion of mothers seeking prenatal care late (third trimester or not at all) fell from 4.0 to 3.9 percent. This percentage decreased from 2.6 to 2.3 for white mothers and stayed the same for mothers of other races (7.1%). In 1986, 86.3 percent of white mothers and 68.1 percent of mothers of all other races initiated care during their first trimester of pregnancy.

Hospitalization and Attendant at Birth

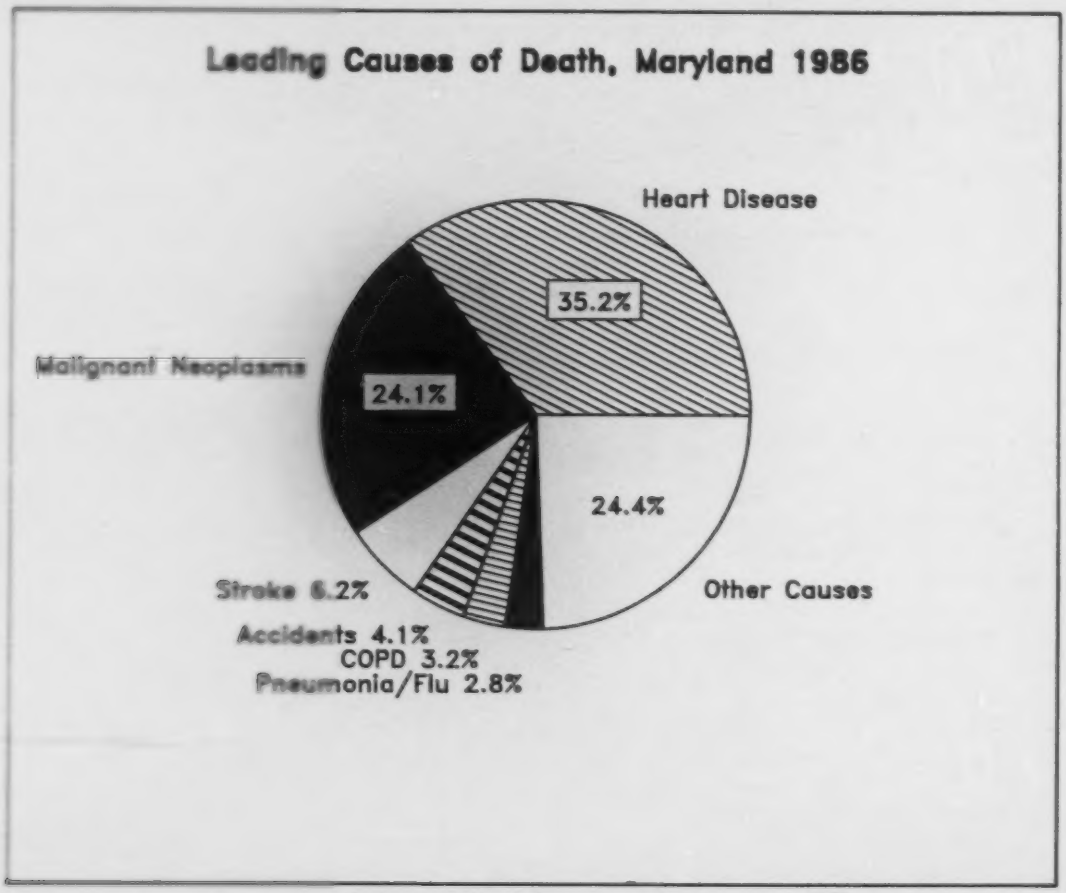
More than 99 percent of all births occurred in hospitals -- 96 percent of hospital births occurred in civilian hospitals. The number of nonhospital births rose to 649 from 601 in 1985. Overall, 97.6 percent of all births were delivered by a physician. The proportion of births delivered by physicians in civilian hospitals was higher (98.5%) than the same proportion delivered in military hospitals (96.6%). More than 34 percent of births not occurring in hospitals were delivered by physicians.

DEATHS

During 1986, there were 37,321 resident deaths, an increase of 2.0 percent over the 1985 total of 36,607. The crude death rate rose to 8.4 per 1,000 population, a 1.2% increase over the 1985 rate of 8.3. The age-adjusted rate stayed the same.

Deaths by Cause

In 1979, the ninth revision of the International Classification of Diseases was first used for coding the underlying cause-of-death. The eighth revision had been in use between 1969 and 1978. Because of coding changes in certain categories of causes of death, comparisons between the 1984 data and data earlier than 1979 should only be made with reference to coding changes. The National Center for Health Statistics has published comparability ratios for mortality data*.



*"Estimates of Selected Comparability Ratios Based on Dual Coding of 1976 Death Certificates by the Eighth and Ninth Revisions of the International Classification of Diseases," Monthly Vital Statistics Report, DHEW Publication No. (PHS) 80-1120, Vol. 28, No. 11, February 1980.

The leading causes of death in 1986 are listed below:

Leading Causes of Death
Maryland 1986

Rank	Cause of Death	Crude Death Rate per 100,000 Population	Percent of Total Deaths
1	Diseases of Heart	294.8	35.2
2	Malignant Neoplasms	201.8	24.1
3	Cerebrovascular Diseases	51.7	6.2
4	Accidents and Adverse Effects	34.1	4.1
	Motor Vehicle Accidents	17.7	2.1
	All Other Accidents	16.4	2.0
5	Chronic Obstructive Pulmonary Diseases	26.9	3.2
6	Pneumonia and Influenza	23.8	2.8
7	Diabetes Mellitus	15.5	1.9
8	Septicemia	13.2	1.6
9	Suicide	12.2	1.5
10	Nephritis, Nephrotic Syndrome, and Nephrosis	10.7	1.3
11	Certain Conditions Originating in the Perinatal Period	10.0	1.2
12	Homicide	9.5	1.1
13	Chronic Liver Disease and Cirrhosis	8.7	1.0

Age-Adjusted* Death Rates for Leading Causes of Death**
Maryland
1985 and 1986

1986 Rank	Cause of Death	1985	1986	Percent Change 1985-1986
	All Causes	583.2	580.4	- 0.5
1	Diseases of Heart	193.0	188.1	- 2.5
2	Malignant Neoplasms	150.6	152.2	+ 1.1
3	Cerebrovascular Disease	31.0	30.1	- 2.9
4	Accidents and Adverse Effects	31.3	29.7	- 5.1
	Motor Vehicle Accidents	16.7	17.1	+ 2.4
	All Other Accidents	14.6	12.6	- 13.7
5	Chronic Obstructive Pulmonary Diseases	17.7	18.0	+ 1.7

7	Diabetes Mellitus	10.8	10.8	-
8	Septicemia	7.6	8.3	+ 9.2
9	Suicide	10.3	11.3	+ 9.7
10	Nephritis, Nephrotic Syndrome and Nephrosis	7.2	6.7	- 6.9
11	Certain Conditions Originating in the Perinatal Period***	-	-	-
12	Homicide	9.0	9.2	+ 2.2
13	Chronic Liver Disease and Cirrhosis	8.5	7.5	- 11.8

*Rates Adjusted to the U.S. 1940 Population by the direct method.
**Per 100,000 Population.
***Age-Adjusted Rate not calculated for certain conditions originating in the Perinatal Period since majority of deaths are under one year of age.

Age-Adjusted* Death Rates for Selected Types of Malignant Neoplasms Maryland, 1970, 1981, 1985 and 1986**

Cause of Death	1970	1981	1985	1986
Total Malignant Neoplasms	148.0	151.3	150.6	152.2
Malignant Neoplasms of Digestive Organs and Peritoneum	39.0	37.7	34.7	36.8
Malignant Neoplasms of Respiratory and Intrathoracic Organs	36.4	42.7	44.4	44.1
Malignant Neoplasms of Breast	13.0	14.4	13.4	13.8
Malignant Neoplasms of Genital Organs	16.1	14.8	14.0	13.5
Malignant Neoplasms of Urinary Organs	5.8	5.8	5.7	5.5
Leukemia	6.0	4.9	4.9	4.8

*Rates Adjusted to the U.S. 1940 Population by the direct method.
**Per 100,000 Population.

Except for homicide and chronic liver disease which traded places, the rankings of the leading causes of death remained the same. Septicemia, the ninth leading cause of death was added to the rankings.

The overall age-adjusted death rate fell less than one percent between 1985 and 1986. Rates for heart disease, cerebrovascular disease, accidents, and chronic liver disease and cirrhosis declined. The largest decline occurred for chronic liver disease and cirrhosis (-11.8%). The greatest increases occurred for suicide (+9.7%) and pneumonia and influenza (+6.7%).

Overall, the age-adjusted rate for malignant neoplasms increased slightly. Increases occurred for malignant neoplasms of the digestive organs and breast.

Deaths by Age, Race and Sex

Age-Adjusted* Death Rates by Race and Sex**
Maryland 1985 and 1986

	1985	1986	Percent Change
All Ages	5.8	5.8	-
Male	7.7	7.6	- 1.3
Female	4.4	4.4	-
White	5.4	5.3	- 1.9

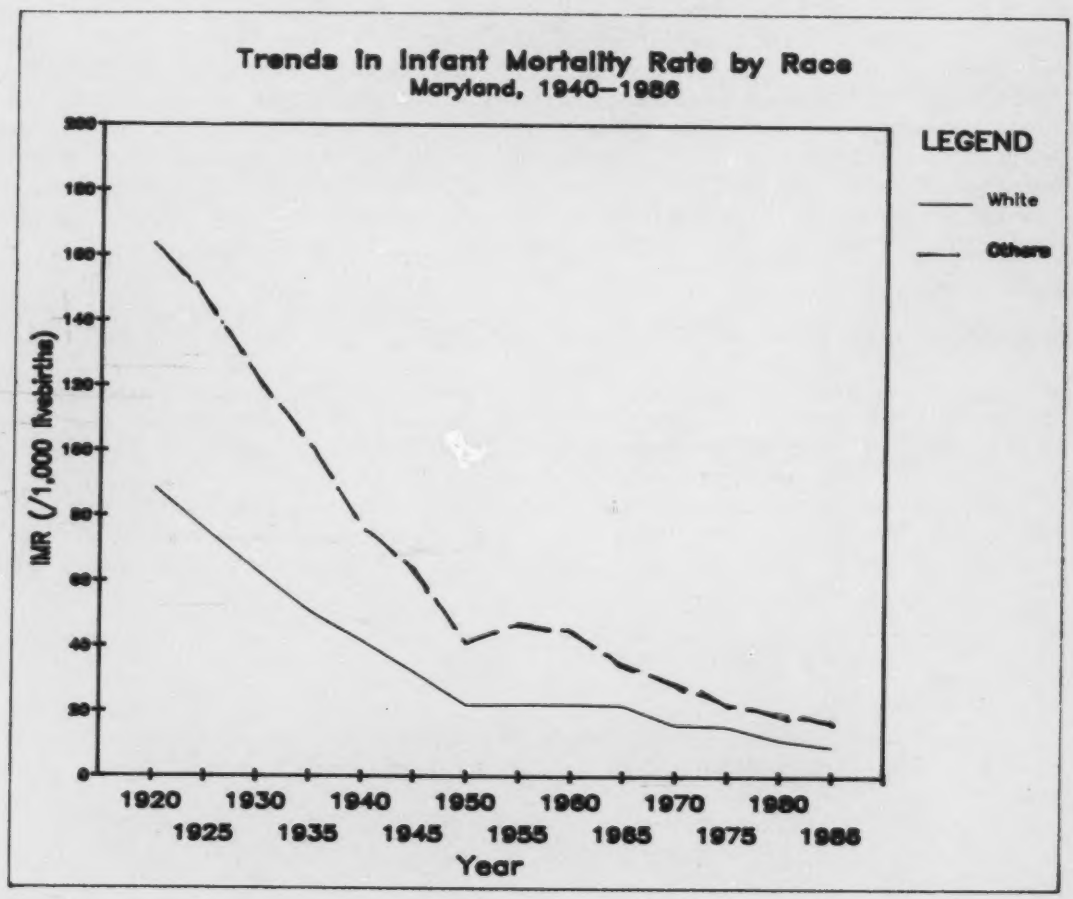
*Rates per 100,000 Population.

MATERNAL DEATHS

There were six maternal deaths to residents during 1986 -- three more than in 1984 and 1985.

INFANT MORTALITY

For the third time, the Infant Mortality Rate fell to its lowest level ever -- 11.7 per 1,000 live births. This rate also occurred in 1983 and 1984. In 1985, the rate rose slightly to 11.9. The rate for white infants rose from 9.0 in 1985 to 9.4 in 1986. The lowest rate -- 8.9 -- had occurred in 1983. The rate for all other races fell 9.6 percent from 17.8 to 16.1 per 1,000 live births -- the second lowest rate ever recorded. The lowest rate ever, 15.7, occurred in 1984.



MARRIAGES

There were 46,361 marriages performed in the State of Maryland in 1986, a slight increase over the total of 46,063 marriages occurring in the State in 1985.

Resident Status

Marriages in which one or both partners were residents of the State represented 82 percent of the total number performed in Maryland. The remaining 18 percent involved couples who were both non-residents of Maryland. Cecil County ranked first with 31.3 percent of all non-resident marriages. Montgomery County ranked second with 14 percent, followed by Washington (9.2%), Prince George's (8.1%), and Garrett (6.8%) Counties.

Civil and Religious Ceremonies

In 1986, 36.8 percent of all marriages performed in Maryland were civil (non-religious ceremonies). For the entire State, more civil ceremonies occurred in Montgomery County than in any other political subdivision. The 2,556 civil ceremonies performed in the county accounted for 14.9 percent of all such ceremonies. When the number of civil vs. religious ceremonies within a particular subdivision was examined, Cecil County ranked the highest and Somerset County the lowest. The 2,043 civil ceremonies performed in Cecil County comprised 61.4 percent of all the marriages in that county, while the 32 performed in Somerset County only represented 22.2 percent there.

Marriages by Previous Martial Status and Age

In 1986, 54.3 percent of all marriages were first-time marriages for both the bride and groom. On an individual basis, 66.7 percent of the brides and 65.3 percent of the grooms were marrying for the first time.

For those marrying for the first time, 15.6 percent of the brides and 5.9 percent of the grooms were less than 20 years of age. For those remarrying, 7.1 percent of the brides and 12.9 percent of the grooms were 55 years of age or older.

DIVORCES

The total number of divorces and annulments granted in the State was 15,608. This represented a decrease of nine percent from the 16,187 recorded in 1985.

Legal Grounds

The leading grounds for all divorces and annulments was voluntary separation. Voluntary separation accounted for 61.4 percent of all divorces and annulments while three years separation accounted for 21.9 percent.

Children Affected by Divorce

The number of children under 18 years of age involved in divorce numbered more than 11,713 in 1986. This represented a decrease of 3.5 percent. The average number of children per divorce was .75. Almost 50 percent of the divorces for which information on children was available reported no children. In addition, 26.8 percent had one child under 18 years of age, while 21.2 percent reported two or more children.

Duration of Marriage

Of the total number of divorces granted in 1986, 2.8 percent of divorced couples had been married less than two years, and 8.2 percent 25 years or more. Fifty-four percent had been married less than 10 years. The median duration of marriage was 8.2 years, indicating that 50 percent of those granted a divorce had been married less than eight years.

DEFINITIONS AND EXPLANATORY NOTES

The data contained in this report are presented on a residence basis, regardless of where the vital event occurred, unless specifically noted otherwise. Information on marriages and divorces is limited only to events occurring in Maryland.

I. DEFINITIONS

The definitions of some of the more frequently used terms in this report are as follows:

A. **Live Birth***: The complete expulsion or extraction from its mother of a product of human conception, irrespective of the period of gestation, which, after such separation, breathes or shows any other evidence of life, such as beating of the heart, pulsation of the umbilical cord or definite movement of voluntary muscle, whether or not the umbilical cord has been cut or the placenta is attached.

B. **Fetal Death***: Death prior to the complete expulsion or extraction from its mother of a product of human conception, irrespective of the duration of pregnancy; the death is indicated by the fact that after such separation, the fetus does not breathe or show any other evidence of life, such as beating of the heart, pulsation of the umbilical cord or definite movement of voluntary muscles.

C. **Infant Death**: Death occurring to a person under age one.

D. **Neonatal Death**: Death occurring to a person under 28 days of age.

E. **Perinatal Death**: Death occurring after 20 weeks of gestation but before 28 days after birth. The perinatal deaths included in this report are, therefore, the sum of the reportable fetal deaths (fetal deaths after 20 weeks gestation) and the neonatal deaths.

F. **Low-weight Birth**: A live birth weighing under 2,500 grams (5 1/2 pounds).

G. **Length of Pregnancy**: A measure of the duration of gestation in completed weeks, as calculated from the first day of the last normal menstrual period to the date of birth.

H. **Birth Rate**: Number of live births per 1,000 population.

I. **Death Rate**: Number of deaths from all causes per 1,000 population. Death rates for specific causes are per 100,000 population.

J. **Infant Mortality Rate**: Number of infant deaths per 1,000 live births.

K. **Fetal Mortality Rate**: Number of reportable fetal deaths per 1,000 total births. Total births include live births plus fetal deaths of twenty weeks gestation or more.

L. **Neonatal Mortality Rate**: Number of neonatal deaths per 1,000 live births.

M. **Perinatal Mortality Rate**: Number of perinatal deaths per 1,000 total births. Total births include live births plus fetal deaths of twenty weeks gestation or more.

N. **Age-adjusted Death Rate**: The age-adjusted rates were computed by the direct method. The age-specific death rates for a given cause of death were applied to the standard U.S. population of 1940. The rates were based on 5 year age groups. Age-adjusted rates should not be compared directly with crude death rates.

O. **Maternal Mortality Rate**: Number of maternal deaths per 100,000 live births.

*The definitions of terms A and B are set by law in Section 14 (a) of Article 43 of the Maryland Code, 1957 Edition - Supplement. However, fetal deaths are reportable for filing purposes only if the death occurs after a gestation period of twenty completed weeks or more (Section 21 (a) of Article 43 supra). Therefore, the fetal deaths included in this report cover only those of twenty or more weeks of gestation.

II. EXPLANATORY NOTE ON POPULATION ESTIMATION

The population estimates used in this report for the entire State of Maryland and the political subdivisions for July 1, 1986 correspond with those which will be published by the U.S. Bureau of the Census in Current Population Reports, Series p-26, No. 87-A.

The subdivision estimates for July 1, 1986 in this report were prepared jointly by the Center for Health Statistics, Maryland State Department of Health and Mental Hygiene and the U.S. Bureau of the Census. The subdivision estimates are computed as an average of the following three methods:

A. **The Regression (Ratio-Correlation) Method**. In the Regression Method, a multiple regression equation is used to relate changes in a number of different data series to change in population distribution. The series of data used in the Regression Method for Maryland are: two-year average of resident births (X_1), elementary school enrollment in grades 1 through 8 plus elementary special and elementary ungraded enrollment (X_2), automobile

registrations (X_3), and individual State income tax returns (X_4). The equation for the 1980's is given by

$$Y = 0.124 + 0.155X_1 + 0.227X_2 + 0.179X_3 + 0.324X_4$$

B. The Administrative Records Method. This is a component method that uses Federal tax data to measure the net intercounty migration of the nongroup quarters population under 65 years old, reported resident birth and death statistics to estimate net natural change, and data on Medicare enrollees to estimate the population 65 years old and over. Tax data are used in the base year and the estimate year to determine the number of persons whose county of residence changed during the period. A net migration rate based on exemptions claimed by the matched cases is applied to the nongroup quarters population under 65 years old. These estimates of migration are then combined with the independent estimates of the population 65 years old and over, inmates of institutions, college students in dormitories, military personnel living in barracks, and the other components of population change (births, deaths, immigration from abroad, and net movement between the military and civilian population) to yield an overall estimate of the total population.

C. State Income Tax Return Method. In the State Income Tax Return Method, the sum of persons filing individual Maryland resident income tax returns plus their spouses are used to estimate the total population 18 years through 64 years of age. These estimates, for each subdivision, are then combined with independent estimates of the populations under 18 years and over 64 years of age, computed as follows, to yield estimates of the total population.

Within the State Income Tax Return Method, the population 5-17 years of age is estimated on the basis of migration rates calculated from school enrollment data (by age, race, and grade) supplied by the Maryland State Department of Education and applied to the "expected" population 5-17 years of age on July 1, of the estimate year. The "expected" population consists of 1980 census survivors from the date of the census to the estimate date. Race breakdowns are based on changes in public school enrollment of all other races as a proportion of all enrollment since the 1980 census.

The population under 5 years of age is estimated by race on the basis of adjusted net migration rates for the school age population applied to the "expected" population under 5 years of age on July 1, 1986. The "expected" population consists of 1980 census survivors and survivors of births occurring between the date of the census and the estimate date (including corrections for "migration exposure").

The population 65 years of age and over is estimated on the basis of data on Medicare enrollments by race and sex supplied by the Social Security Administration, U.S. Department of Health, Education and Welfare. The changes in the Medicare enrollments for each age-race-sex group for the estimate year are applied to the population estimates of the previous year.

In addition to the above estimates, the Center for Health Statistics estimates the population 18-64 years of age in detailed age groups by race and sex as follows:

Age and race-specific driver license statistics for males obtained from the Maryland Department of Motor Vehicles are used to estimate the male population aged 18 to 64 years in several stages: 18 to 19, 20 to 24, etc. Sex ratios, based on the 1980 census, are used to estimate the female population. These estimates of the 18-64 population are then adjusted so that the sum of all age groups in each subdivision equals the population estimate for the subdivision. Various adjustments for changes among "special" groups of persons, i.e. , those in institutions, in the armed forces, or spouses of members of the armed forces, are utilized in estimating the various age groups before adjustments are made to the final subdivision estimate.
